Information on toxicological effects

Symptoms Large doses of bifenthrin ingested by laboratory animals produced signs of toxicity including convulsions, tremors and bloody nasal discharge.

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Chronic toxicity Bifenthrin: Long-term exposure caused neurotoxicity (tremors and impaired gait) in the early exposure in animal studies, but tremors disappeared with continued exposure.
Mutagenicity Bifenthrin, Abamectin: Not genotoxic in laboratory studies.
Carcinogenicity Bifenthrin: Weak treatment-related response for liver adenocarcinomas and benign bladder tumors (lesion) in male mice. Abamectin: No evidence of carcinogenicity from animal studies.
Neurological effects Bifenthrin: Causes clinical signs of neurotoxicity (tremors, impaired gait, excessive salivation) following acute or subchronic exposure. Tremors disappeared with continued exposure. Abamectin has produced central nervous system effects in animals.
Reproductive toxicity Bifenthrin: No toxicity to reproduction in animal studies. Abamectin: Reproductive toxin in animal studies only at doses acutely toxic to the maternal animal.
Developmental toxicity Bifenthrin, Abamectin: Not teratogenic in animal studies.
STOT - single exposure Causes damage to organs: See listed target organs below.
STOT - repeated exposure Causes damage to organs through prolonged or repeated exposure: See listed target organs below.
